Summary of Qualification

Software Engineer with 4 years of experience designing and building backend systems using Python, Flask, Firebase, Docker, and Google Cloud Platform. Developed **5 backend services**, **100+ REST endpoints**, and greenfield applications across healthcare, sports, smart cities, and enterprise domains, taking ownership from architecture to production deployment.

Experience

• Software Engineer at QuatroIn (Brazil) | 09/2023 - Present

Software Engineer II : 08/2024 - Present

Led the end-to-end development of five backend services and multiple greenfield applications, taking ownership of architecture, database design, implementation, cloud deployment, and long-term maintenance while working directly with clients to gather requirements, define technical solutions, and deliver production-ready software.

- **Project A (Coach-Runner Platform):**
 - Sole developer responsible for designing and implementing a running coaching platform used by **2 coaches and 70 athletes**, delivering over **70 weekly training plans**, **245 training sessions**, **140 automated weekly messages**, and approximately **22 daily training uploads**.
 - Designed the complete backend architecture with **Python Flask**, **Firebase**, and **Google Cloud**, implementing secure authentication, more than **100 REST endpoints**, automated messaging workflows, and CI/CD pipelines for continuous deployment.
- **Project B (ICU monitoring):**
 - Led a team of **3 developers** in building a healthcare solution composed of **three Flutter applications** and shared Python Flask services for ICU monitoring, supporting **12 hospital beds** and **10 healthcare professionals**.
 - Designed the backend architecture and integrated a computer vision OCR pipeline to automate extraction of medical monitor data, reducing manual transcription during patient monitoring.
- **Project C (Enterprise managing platform):** Contributed to an enterprise Java/React platform composed of 12 business modules and used by approximately 1,500 users.

Software Engineer Intern: 09/2023 - 08/2024

- Developed dashboards for distributed STM32 IoT device monitoring and improved embedded firmware to increase telemetry reliability in hostile environments.
- Collaborated on cloud deployments, production debugging, documentation, and client-facing technical discussions within an agile development team.

Tech Stack: Python Flask, Git/GitHub, Next.Js (TypeScript), Docker, Firebase, Google Cloud Platform (GCP), Flutter, NoSQL, Microservices, MySQL, Java, React, Javascript, C/C++.

• Software Engineer Intern at University of Western Santa Catarina (Brazil) | 08/2022 - 12/2023

- Developed a Python application for real-time acquisition, visualization, and storage of EMG and encoder signals for biomedical rehabilitation research.
- Integrated embedded hardware with MySQL databases through serial communication to support laboratory experiments.

Tech Stack: C/C++, Git/GitHub, Python, MySQL.

• Firmware Developer Intern University of Western Santa Catarina (Brazil) | 08/2021 - 08/2022

- Developed embedded firmware in C/C++ for biomedical rehabilitation equipment, implementing reliable serial communication for EMG and encoder acquisition.
- Participated in PCB design, hardware validation, and system testing throughout the research lifecycle.

Tech Stack: C/C++, Python, EasyEDA.

Education

- **Computer Engineering:** University of Western Santa Catarina. 2020 - 2024.
- **Languages:** Portuguese and English
